

ABSTRACT

1 An automatic document-scanning method for scanner is applicable to a
2 document and comprises the following steps: (A) Previewing the document; (B)
3 Performing optical character recognition of the written language on the document
4 and calculating the deflection angle thereof; (C) Scanning the document; and (D)
5 Automatically correcting the image of the scanned written language obtained in
6 step (C) basing on the deflection angle. By above-mentioned method, even a
7 slantingly misplaced document set on a document-loading panel of scanner can be
8 properly amended in its orientation such that a normally oriented document image
9 is providable to the scanner user.
